

Data engineers and scientists will hate you for these simple tricks!

AMAZING 🌟🌟🌟

5 Tricks for Jupyter **you need to know!!!**

1 JupyterText

Jupyter

- Simple plugin for jupyter
- Paires jupyter notebooks with a python script
- Add *.ipynb to your .gitignore, only check-in paired python script

- Advantages:

- Git-friendly notebooks
 - Commits finally look useful
 - Work simultaneously on notebook and merge automatically (with git)
- Never accidentally commit data again
- Switch between your notebook for quick try-outs and your IDE for refactors

IPython Magic

5 Jupyter Extensions

Five More Tricks

A

Execute a notebook as a script:

```
jupyter-nbconvert --to html --execute --ExecutePreprocessor.timeout=None file.ipynb
```

B

Real progress-bars in notebooks:

Replace `from tqdm import tqdm` with `from tqdm.notebook import tqdm`

C

More magic:

Add `!` before a command to run it in the shell (e.g. `!pip install numpy`), add `?` before a command to see its doc-string

D

Multicursor support:

Use `Ctrl + Click` to add a 2nd / 3rd / ... cursor and edit multiple lines of code simultaneously

E

Notebooks without backend:

JupyterLite (jupyterlite.readthedocs.io) runs completely in the browser, using WebAssembly

DISCLAIMER

- Still, Jupyter Notebooks should only be used for:
 - Rapid prototyping
 - High-level interfaces
- Whenever something needs to be even remotely re-usable, it should be ...
 - ... factored out into a separate module
 - ... unit-tested
 - ... documented (e.g. docstrings)
